The star has been located (until somebody finds one better):

=Wolf 294=

Location: RA: 6 hr 51m 35s. Dec.: 33, 20.

Constellation Location: Gemini

Distance from Sol: 19.4 light years

Spectral Class: dM4

(dwarf red star with no emission lines, i.e., not a flare star--they erupt, which would probably cause problems at habitable planets)

The arguments in favor:

--red star as per text re: pink light, no blue output from star.

--a Wolf star (that isn't a flare star).

--less than or equal to 20 light years from Sol.

--(special bonus) located in the constellation of the Twins.

Your Copernican Correspondent turned crispy critter,
